

# SINGLE LINE REEF

## Instant reefing with Single Line Reef

Single Line Reef is made practical and reliable by Seldén. All you do is ease off the halyard to premarked reefing points and then haul in on the reefing line. The luff and the leech are reefed at the same time. A system of guided blocks inside the boom ensures that the lines do not tangle. The system has a 2:1 gear ratio, making reefing fast and simple, without having to leave the cockpit.

Single Line Reef. Pulls down luff and leech at the same time. Operated from the safety of the cockpit.

# How to operate a Single Line boom

*Release the Rodkicker.*

*Slacken the mainsheet.*

*Ease off the main halyard to premarked reefing points.*

*Tension the reef line up to the marked position the line.*

*The reef is in.  
Remove any slack in other reefs.*

*Adjust the mainsheet.*

*Adjust the Rodkicker.*

*It's as simple as that!*

# Boom sections choice

To select the correct boom section, you will need to know the sail foot length (E) and righting moment (RM). If the RM is not known, displacement is an alternative.

The E and Y measurements must also be known for dimensioning purposes. The length of the boom is sometimes determined by other factors than E and therefore we need the S measurement as well. A good example is when the boom extrusion needs an over-length to allow the main sheet to pass a sprayhood.
